I. Introduction of the marine environment forecast products and service

➤ The administrative infrastructure of the marine environment forecasting systems in China

Introduction of the marine environment forecast products and service

➤ **Products and services in China**

•The marine environment forecast products in China mainly include:

- ocean waves
- sea surface temperature
- storm surge
- sea ice
- tide, tidal current
- ship best route selection

...

Services:

Coverage: China seas and the northwest Pacific

Parameters:

| | |
|----------------|--|
| wave forecast: | everyday by TV, telefax, etc. |
| SST: | in ten-day |
| Storm Surge: | storm surge news, warning or urgent alarming |
| Sea Ice | in ten-day period or monthly in winter |

Forecasting Method

- The empirical forecasting method
 - Cities coast, Travelling areas
- The mathematical-statistical method
 - Weekly, Monthly
- The numerical forecasting method
 - Daily, Now-cast

Time Scales

- Annual
 - Typhoon, ENSO, Tide, Sea ice
- Monthly
 - Weather, Ocean Wave, Storm Surge, Sea ice (in winter)
- Weekly
 - Weather, Ocean Wave, Storm Surge, Sea Temperature, Red tide, Sea ice (in winter)
- Daily
 - Weather, Ocean Wave, Storm Surge, Sea Temperature, Sea current, Ecosystem, Sea ice (in winter)
- Now-cast
 - Oil spill, Green tide, Rescue

Forecast Models

China

- Sea Temperature and Current
 - MOM4, ROMS, HYCOM, POM, FVCOM
- Ocean Wave
 - WaveWatchIII, WAM, SWAM
- Storm Surge
 - CTS (China Typhoon Surge) Model, CES (China Extratropical Surge) Model, High Resolution Orthogonal Curvilinear Typhoon Surge Forecast Model (CTS-CUR), Storm Surge Inundation Model (CTS-WD)

Europe

- Sea Temperature and Current
 - PSY3V2(NEMO, OPA9 + LIM), FOAM, POLCOMS , TOPAZ3 (HYCOM), DMI-BSHCmod Ver.2 , MFS V2
- Ocean Wave
 - BMO model in UK, HYPAC model in Germany, VENICE model in Italy, WAM in ECMWF, NTUA model in Greece
- Storm Surge
 - POL storm surge model in England
 - DCSM system in Netherlands

Forecast Models

China

- Sea Ice
 - Hibler Sea Ice Model, Particle in Cell (PIC) Sea Ice Model, Ice-Ocean Coupling Model
- Ecosystem
 - FVCOM Coupled with EPA Water Quality Model, COHERENS Model, EFDC Model
- Tsunami
 - Operational China Tsunami Transit Time Forecast Model (CTTT), Operational China Numerical Forecast Model of Tsunami (CTSU)

Europe

- Sea Ice
 - TOPAZ
- Ecosystem
 - MRCS, Medium-Resolution Continental Shelf ERSEM, the European Regional Seas Ecosystem Model
 - HadOCC, the Hadley Centre Ocean Carbon Cycle model
- Tsunami

II. Typical Ocean and coastal information products and the difference

Ocean waves

Marine environmental parameter profile simulation and forecasting

(1) Ocean Wave

□ Background and Research

The late-1980s, NMEFC started the ocean wave forecasting.

MRI model from Japan, BMO model from UK,
WAM model

Ocean wave numerical model development in China

The 7th- 5 year and the 8th -5 year science and technology program

Wen model (1994,1999), the hybrid ocean wave numerical model

Wave Energy Numerical Model (WEN model)

Ocean University of China

WEN model running operationally in NMEFC and local marine forecasting center

LAGFD-WAM wave model proposed by Yuan et al (1992)

Based on WAM model with the modification of source function in wave energy diffusion and considering wave-current interaction

Especially used in ocean engineering computation.

At present, 3 projects related ocean wave numerical model are carried out in NMEFC in the 11th-5 year program

- Operational ocean wave numerical model for coastal area with high efficiency
- The fine wave forecasting technique for the fixed point in coastal area
- The global ocean wave numerical model

According to Ocean Yearbook 2008

□ **Ocean wave model, product and service**

Operational ocean wave numerical model are carried out in NMEFC of the State of Ocean Administration (SOA) and in National weather forecasting center of China Meteorological Agency (CMA)

➤ NMEFC operational ocean wave numerical model

Model: SWAN model for shallow water
 WAM4 model for deep water
 NMEFC model for shallow / deep water
 WEN model for shallow / deep water

Coverage: Northwest Pacific ocean

10-45N 105-155E with grid 0.5x0.5

Yangtze River Esturary

29-33N 120-123E

Beibu Gulf

18-22N 105-110E

with grid 1/30x1/30

Bohai Sea

37-41N 117.5-122.5E

Wind forcing field: NMEFC ocean wind numerical model
10-45N 105-155E with grid 0.5x0.5 based on MM5

Basetime and forecasting time step:
20:00 Local time T+0 – T+72 hrs

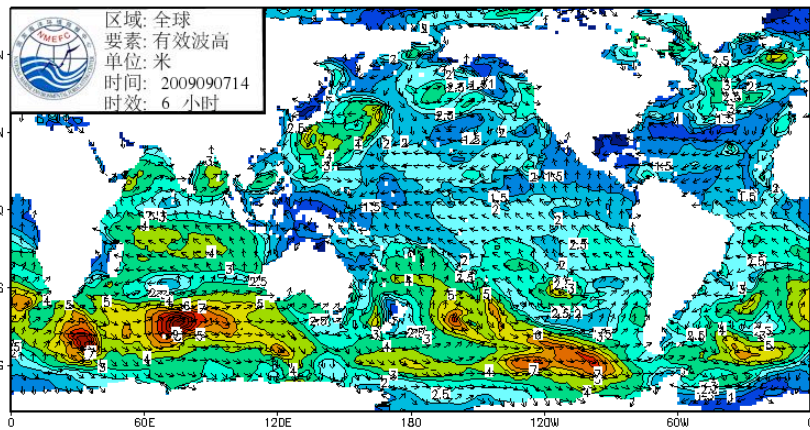

Forecasting products
Service: <http://www.nmefc.gov.cn/szyb/qh1.aspx>

CCTV, radio, telefax, etc

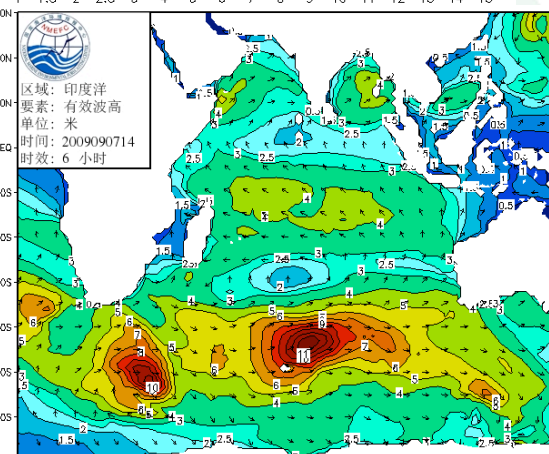

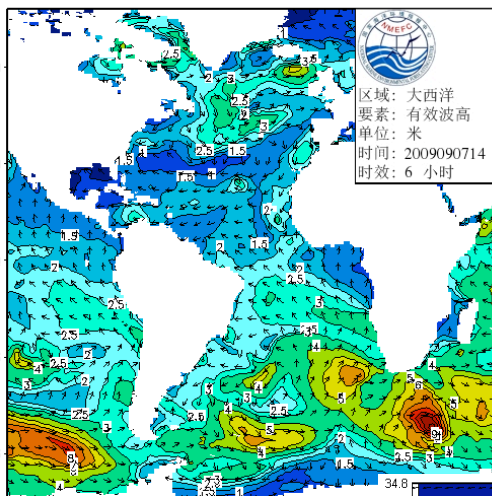

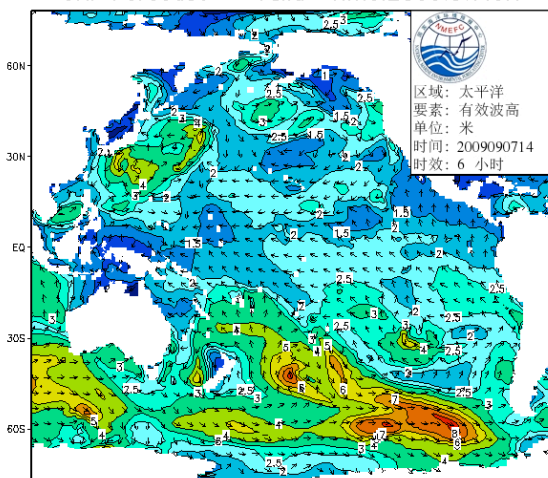

Download available but for registered user only

<http://mds.coi.gov.cn/ybfw.asp>

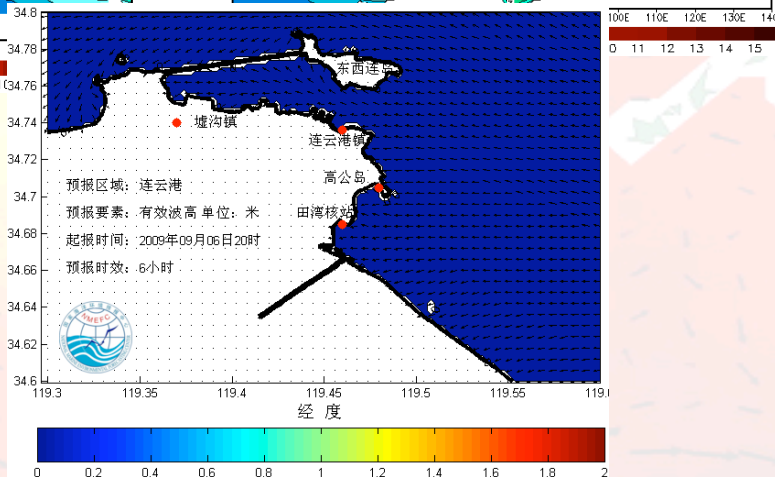

国家海洋科学数据共享中心 NMDIS

6Hr Forecast Valid Time:2009:9:7:6H

2009年09月06日20时: 6小时有效波高预报 最大波高=6米

National Weather Center of China Meteorological Agency (CMA) provide global ocean wave forecasting service.

Model: WAVEWATCH III

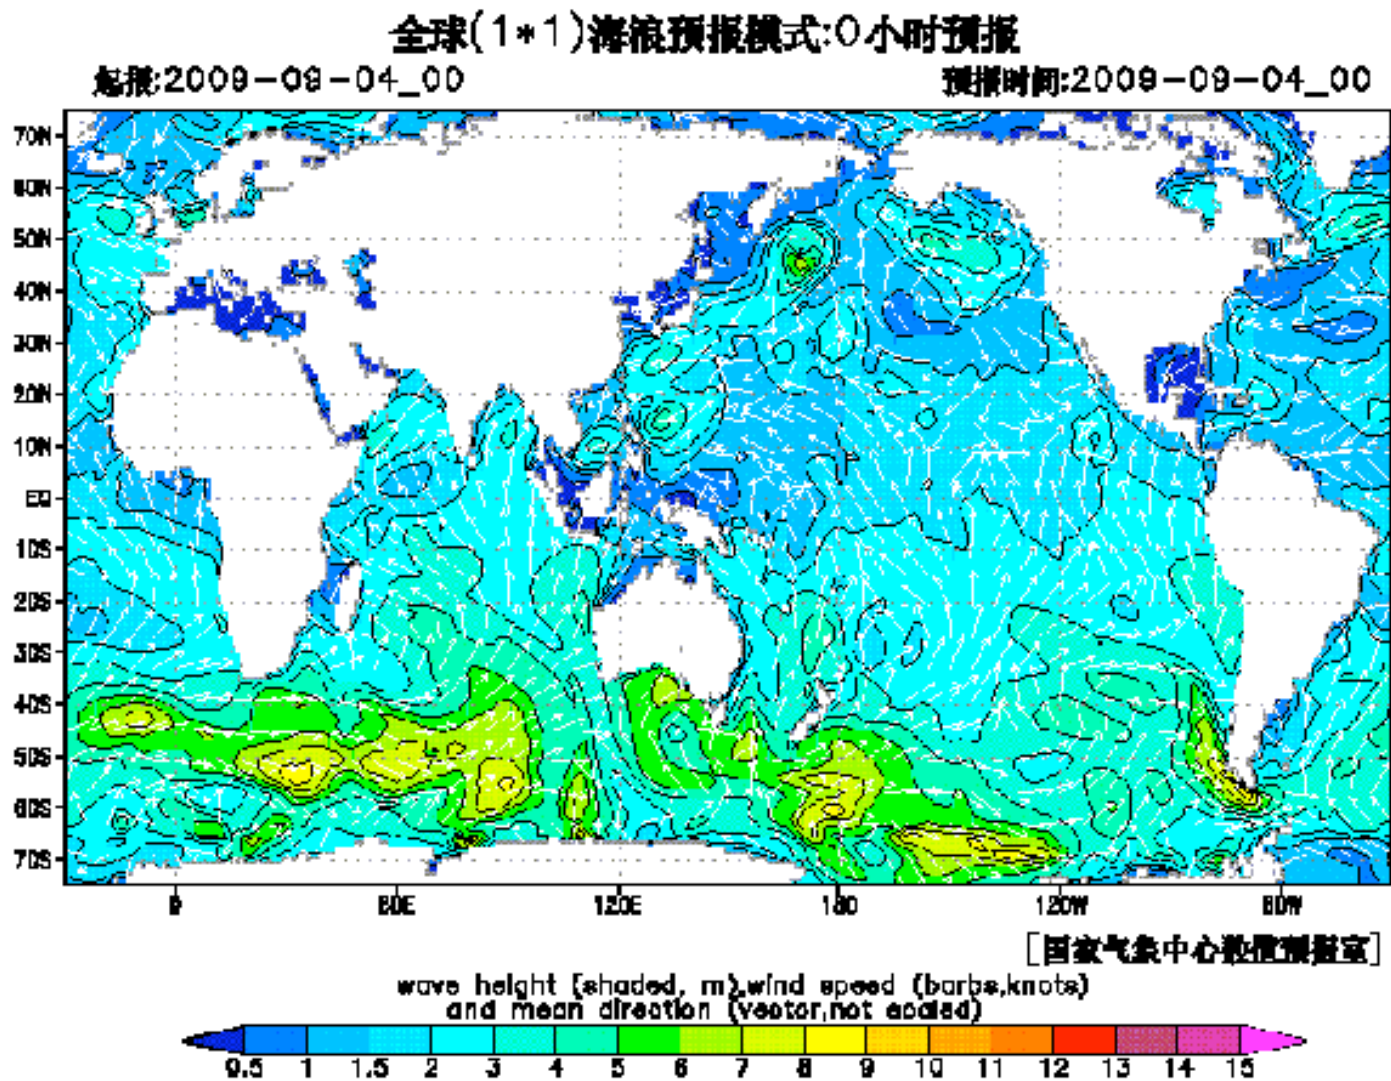

Coverage: global ocean with grid 1x1 degree

Wind field: the medium-range numerical weather forecasting system (T213)

Forecasting: 72 hrs

Data verification: NOAA/NDBC buoy data

Model products: <http://www.nmc.gov.cn/publish/nwp/ww3/index.htm>

□ **European ocean wave numerical model**

Many different wave model runs operational in Europe.

BMO model in UK

HYPAC model in Germany

VENICE model in Italy

WAM in European Centre for Medium-Range Weather Forecasts (ECMWF)

WAM in ECMWF

WAM 4 one of the most popular wave models

Operationally working more than 10 years in Europe

Coverage: for global ocean with grid of $1/4 \times 1/4$ degree

for European waters with grid of $1/8 \times 1/8$ degree

Products:

<http://www.ecmwf.int/products/forecasts/wavecharts/index.html#forecasts>

Only registered user and WMO member can access

**Global ocean wave model
Parameters**

• **Forecast and Analysis fields**

- 2D wave spectra (2DFD)
- Mean direction of total swell (MDTS)
- Mean direction of wind waves (MDWW)
- Mean period of total swell (MPTS)
- Mean period of wind waves (MPWW)
- Mean wave direction (MWD)
- Mean wave period (MWP)
- Mean wave period based on second moment (MP2)
- Mean wave period based on second moment for swell (P2PS)
- Mean wave period based on second moment for wind waves (P2WW)
- Peak period of 1D-spectra (PP1D)
- Significant height of total swell (SHTS)
- Significant height of wind waves (SHWW)
- Significant wave height (SWH)

Product resolution

- 0.25° x 0.25° lat/long grid or any multiple thereof (global or sub-area)

Forecast time-steps

- T+3h to T+72h at 3-hour intervals and T+78h to T+240h at 6-hour intervals
- T+6h to T+120h at 6-hour intervals for 2D wave spectra (2DFD)

Base times

- 00 UTC, 12 UTC

Analysis times

- 00 UTC, 06 UTC, 12 UTC, 18 UTC

ECMWF wave model products:

As only registered user and WMO members can access the data no data example available shown here.

ECMWF WAM model development:

- The introduction of the assimilation of altimeter wave height data;
- The two way wind-wave interaction;
- The effects of unresolved bathymetry;
- A new dissipation source function;
- 4D var assimilation of all sky microwave imager data in model Cycle 3552

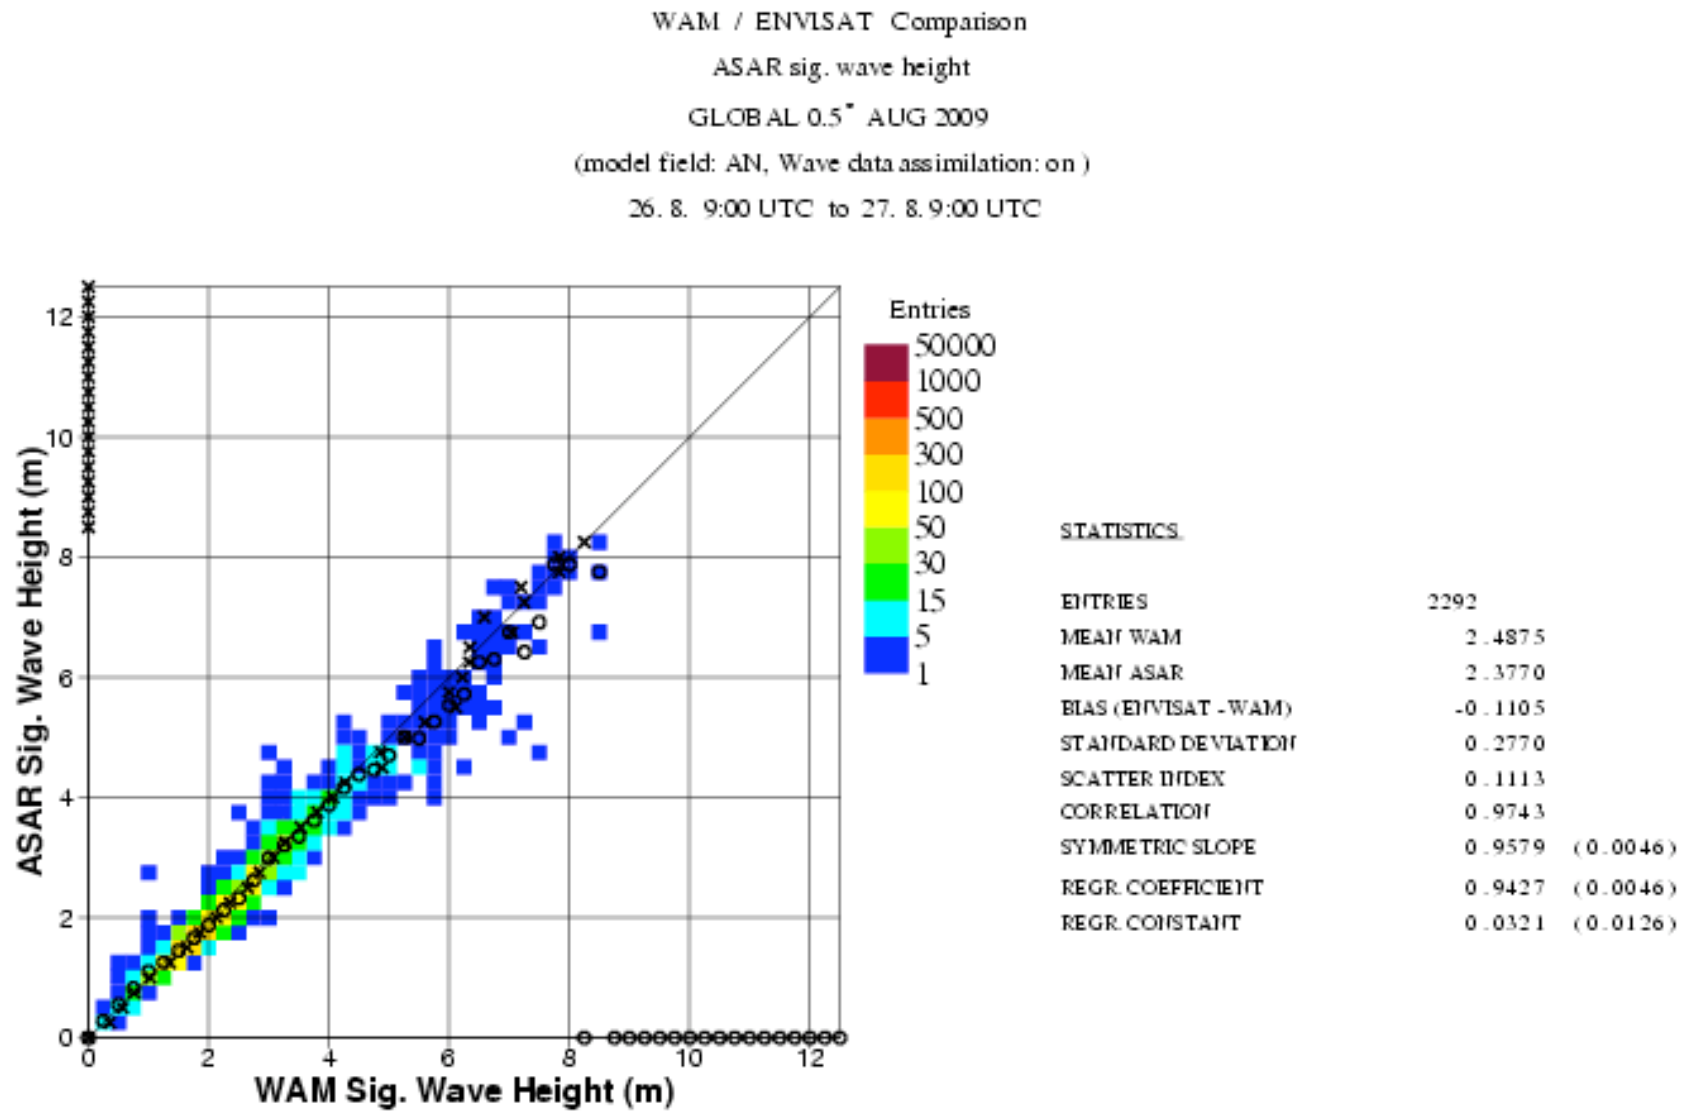

Model product verification:

In situ ocean wave observations

Satellite data assimilation in WAM Cycle 3553:

The significant wave height from Envisat/ALT and Jason-2

The Envisat/SAR wave mode data

□ The difference or gaps in ocean wave numerical model forecasting

- The accuracy of ocean wave numerical models relies entirely on the quality of input meteorological data. The research for the forcing wind field is not paid much attention to up to now.
- In situ ocean wave monitoring buoy or related equipment is very limited. Little in situ data could be used in model verification / validation in China seas.
- Compared with ECMWF, no altimeter or other satellite data is assimilated in ocean wave numerical model at present in China.
- The wave numerical model forecasting product and its utilization should be improved.
- Ocean wave numerical model should be improved as the new research result on ocean wave or data assimilation appears.

(Refer to Xu (2005))

(2) Marine environmental parameter profile simulation and forecasting

□ Background and research

- **The SST empirical forecasting** is based on SST's continuity, periodic, similarity and its relationship to other parameters.
- **The mathematical-statistical forecasting method** is based on several mathematical-statistical forecasting equations established by Ocean University of China and NMEFC respectively, and it was the main SST forecasting method before the late-1980s.
- **The SST numerical forecasting method**
developed in the 1980s under the support of the national 7th -5year science and technology program with the project entitled "Marine environment numerical forecasting research" (NMEFC and OUC).

- The **three-dimensional ocean numerical model** for China Seas
Bohai 3-dimensional ocean model developed by NMEFC in 2004
Model coverage: 10-45N, 103-145E with a spatial resolution of $1/12^\circ \times 1/12^\circ$
the sigma coordinate in the vertical direction with 21 layers
The initial field: WOD global dataset.

- 3-dimensional ocean numerical model for Taiwan and its adjacent areas**
a resolution of $(1/30^\circ \times 1/30^\circ)$
21 layers in vertical direction (sigma coordination)
on the basis of the Princeton ocean model (POM) model.

- ocean-atmospheric coupling model based on the MM5v3 atmospheric model and the POM ocean model**
by NMEFC and Shanghai Typhoon Research Institute
Verification: the in-situ data (buoy data, telemetry data and remote sensing)

- 3-dimensional ocean assimilation research**
by Ocean University of China and NMEFC
established **temperature vertical structural model and a three dimensional assimilation system.**

ocean wave-circulation theory and developed ocean wave-circulation coupling model (Qiao et al, 2004) and The atmospheric-ocean waves-circulation coupling numerical model (Song et al 2007))

➤ **Assimilation methods in simulation**

A general ocean data assimilation system, based on the 3D variation method, which can be used to **assimilate in situ temperature/salinity data and altimeter data.**(Zhu et al. 2007)

➤ **Model development in China**

Global ocean circulation model, Ocean circulation model in the North Pacific T63L30 by IOA/CAS, CMA, FIO/SOA during the 9th-5 year Program

3D ocean numerical model based on POM

Ocean circulation model in the Northwest Pacific ocean based on MOM

T63L30 ocean circulation model with the grid of 0.5x0.5

during the 10th-5year program

□ **Ocean numerical model, product and service**

NMEFC has established **ocean current numerical model based on MOM4 model for the global ocean and HYCOM for the Pacific ocean, and the regional simulation model on the basis of POM, FVCOM for China Seas.**

Like: 3D ocean numerical model for Bohai Sea

Coverage:

117.5-112.5E and 37-41N with the grid of 2.5'x2.5'

Model output at the depth: surface, 5m, 10m

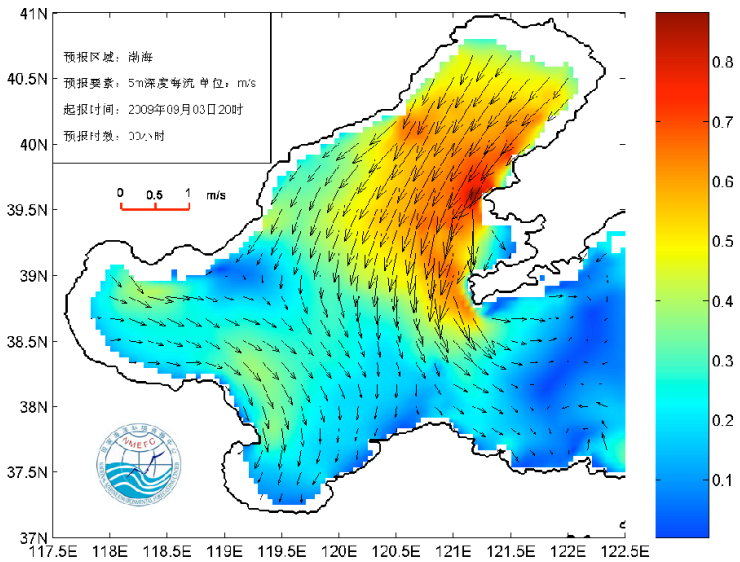

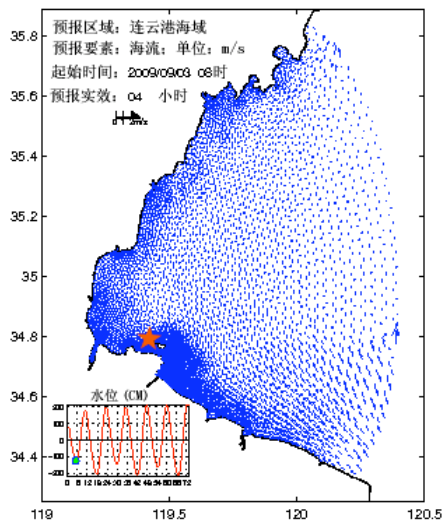

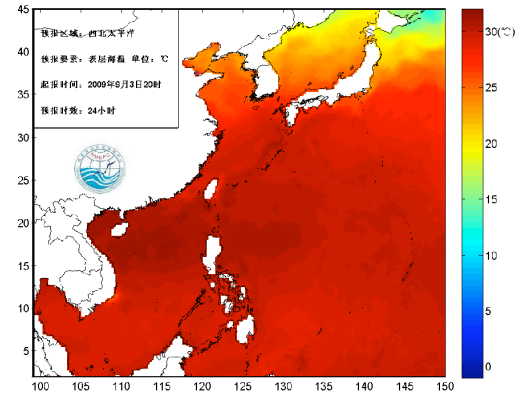

Forcing field: wind, air temperature, and humidity provided by NMEFC ocean wind numerical model

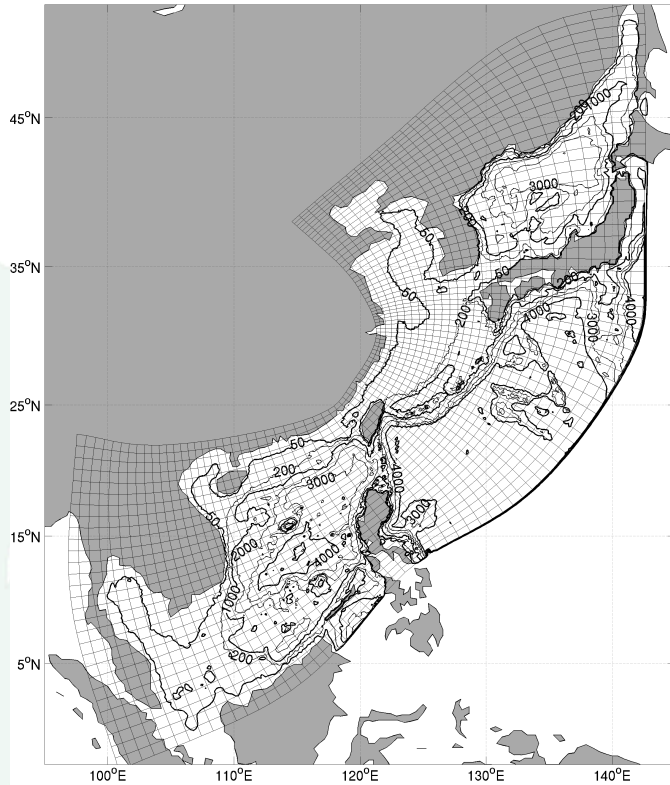

Model products:

published at the homepage: <http://www.nmefc.gov.cn>

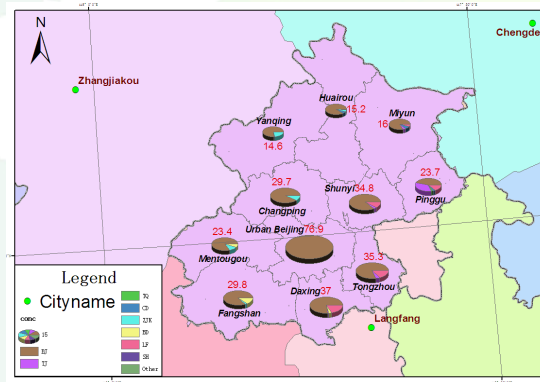

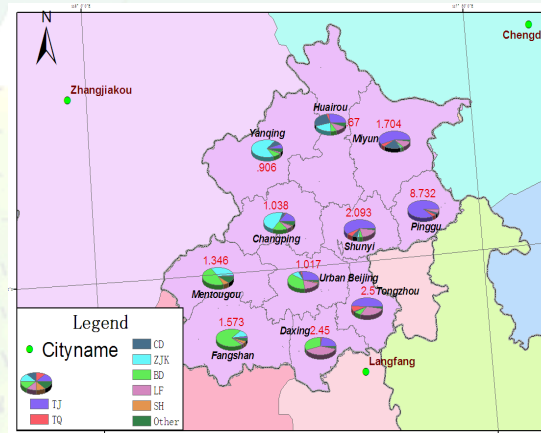

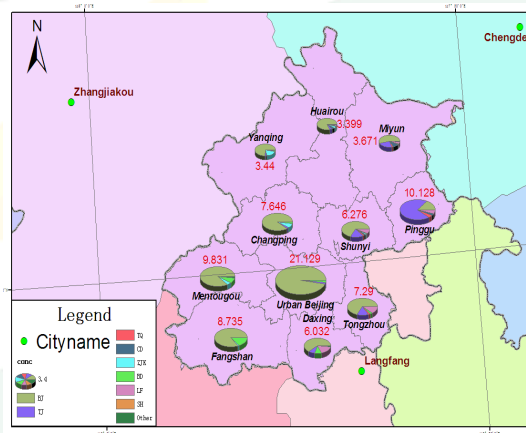

Chinese Forecasting Systems

Model result - current

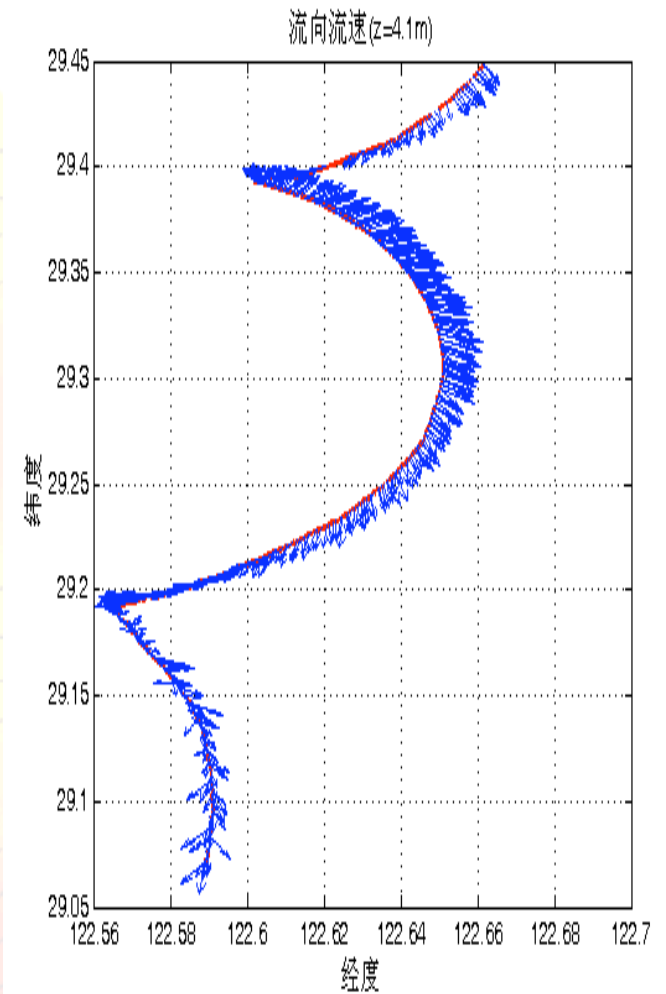

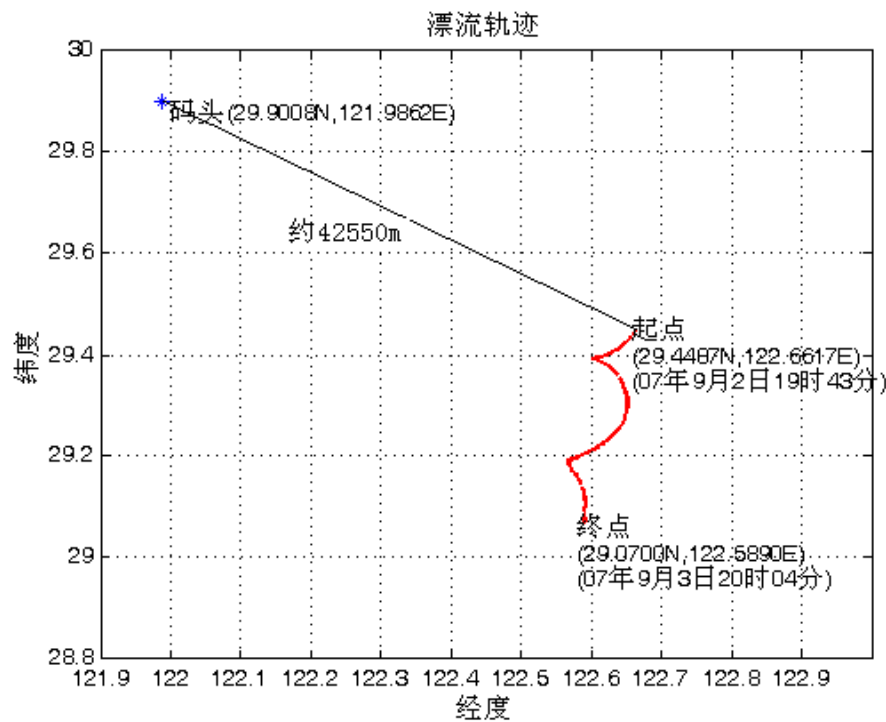

The model domain and the SST forecast error growth in SCS.
 The blue curves are prediction and the red curves are persistence

Contribution of surrounding areas to monthly mean SO₂ concentration (ppb) and monthly mean PM₁₀ concentration (µg/m³) over Beijing counties including Beijing local contribution (left) and without Beijing local contribution (right) under base scenario.

□ **Main gaps compared with European ocean numerical model**

European Oceanic Forecasting Systems-----A Joint Effort

The European countries are now trying to integrating the available ocean forecasting products through some joint projects, for example, the **Myocean** project (following the **Mersea** project.)

These projects will allow all users to **access a catalogue of worldwide and European regional Ocean Products** (real time observations, analysis and forecast, added value diagnostics) that have been made available under previous projects step by step.

These efforts are gathering **all the relevant European capabilities to ensure that operational systems are maintained at the most advanced level**. Most of the operational forecasting systems are using sophisticated schemes for model parameterizations and data assimilation.

Model Configuration and outputs-----Basin scale to regional

The European oceanic operational forecasting systems usually provide both global/basin scale coverage forecasts and regional forecasts. The resolutions of **the global/basin scale forecasts vary from 2° to 1/12° in the close future** and the resolution of **the regional forecast is usually higher than ~1/12**. There are usually 30~50 vertical levels in the simulation systems.

Forecast products include temperature, salinity, zonal and meridional velocity, free surface elevation, sea ice variables (thickness, concentration, temperature, zonal and meridional ice velocity, snow thickness on ice, ice heat content), mixed layer depth (density diagnostic), mass transport by density class through sections and meridional heat transports. All these products will be available through **MyOcean** web site.

Sophisticated assimilation schemes in European forecasting systems

All of the operational oceanic forecasting systems are (or will be) using sophisticated assimilation schemes to better the forecasts. **The optimal interpolation, different forms of Kalman filters, SEEK filter (ensemble base scheme) and variational methods** are widely used. Some are fully multivariate and multi data schemes. There are weekly to daily analysis and forecast.

Satellite data (sea level anomaly, sea surface temperature, sea surface wind) and in-situ measurements (temperature, salinity and current) are assimilated in most of the operational systems.

MyOcean and the future european organisation:

Forecast, observations and diagnostics will be available on a single web site. They will be 7 MFC (Monitoring and Forecasting Center, 1 global and 6 regionals) and 6 TAC (Thematic Assembly Center) for observations:

- Insitu Data
- SST
- Ocean Color
- SLA
- Atmospheric forcing
- Sea Ice

The forecasting centers (global and regional) have to be fully operational at the end of MyOcean project.

MyOcean Products & Services

SERVICE ONLINE CATALOGUE SERVICE DESK DATA POLICY

MYOCEAN SERVICE

MyOcean service, in its V0 version, allows all users to access a catalogue of worldwide and European regional **Ocean Products** (real time observations, analysis and forecast) that have been made available under previous projects such as MERSEA, MARCOAST, POLARVIEW, ECOOP, GLOBCOLOR.

MyOcean service will evolve during the project live towards a comprehensive and fully operational service.

V0 Service, at beginning of the project - April 2009
Centralized access to **a part of** the existing products. For user's convenience, available products have been gathered and made accessible through a single "Online Queryable Catalogue". In this version, the products are hosted on their respective web portals.

V0 Service, after 6 months of the project - October 2009
Centralized access to **all V0 products** (see [MyOcean V0 catalogue](#)). Products are gathered and accessible through a single "online queryable catalogue". V0 products are still hosted on their respective web portals.

V1 Service, at the end of year 2010
MyOcean pan-European full fledged service will offer a single and reliable entry point to users and a direct access to products. The web portal will be directly connected to production units all over Europe to ensure homogeneity and full operability. Service will include INSPIRE functionalities (discovering, visualisation and downloading tools, ...) and a 24/7 HelpDesk. V1 Products will follow MyOcean Data Policy : open and free to any user and for any use.

Remarks

Ocean environmental forecasting system and the related products could be provided are introduced. We take ocean wave forecasting and ocean model simulation as examples to discuss the main difference of ocean environment numerical forecasting between China and Europe. The main gaps could be summarized as follows:

- **The initial forcing field and data assimilation availabilities.** The wind field with high quality and accuracy are needed in both ocean wave modeling and ocean numerical modeling. 4-D variables data assimilation especially with in situ data and satellite data should be much improved in the future.
- **Mechanism of some key physical process studies and parameterization** especially in coastal area. Air-sea interaction and coupling techniques. Further studies are needed in air-sea coupling processes including wind storm – wave – tide – current – ice processes, and solar radiation and its scattering processes, and atmosphere – ocean coupling techniques.
- **Model products' verification and validation.** Class 1-3 metrics are introduced in ocean numerical modeling in MERSEA.
- **In situ data, satellite data and model forecasting data service should be improved.** The model and related information should be provided accompanying with the model products.

Remarks

Mean differences are:

- **No real operational european coastal products.** Europe starts from regional and global to coastal areas. Downscaling is in preparation.
- **European centralisation of input data and output products in dedicated centers.**
- **Products access mostly freely via web site.**

Thank you for your attentions !
